## SMBUS Frequency Clock Generator for Advanced Mobile Pentium® III Applications.

### Product Features

- Supports Advanced Mobile Pentium® III CPU.
- 2 CPU clocks.
- 7 independent SDRAM clocks for 3 SO DIMMs.
- Power Management hardware support.
- 7 PCI synchronous clocks.
- < 175 pS skew CPU and SDRAM clocks.
- < 175 pS skew among PCI clocks.
- SMBUS 2-Wire serial interface
- Programmable registers featuring:
- Individual clock enable/disable
- Mode as Tri-state, test, or normal
- 24/48 MHz selections
- Enable/Disable SST
- Available in 48-pin SSOP and TSSOP packages
- Spread Spectrum Technology (SST)
- Dial-a-Frequency™ Feature

**Pin Description**

Pin No.	Pin Name	PWR	I/O	TYPE	Description
1,2,45, 47	<b>REF(0:3)</b>	VDD	O		Buffer output clocks of the reference signal at Xin.
4	<b>Xin</b>	VDD	I	OSC	On-chip reference oscillator input pin. Requires either an external parallel resonant crystal (nominally 14.318 MHz) or externally generated reference signal
5	<b>Xout</b>	VDD	O	OSC	On-chip reference oscillator output pin. Drives an external parallel resonant crystal. When an externally generated reference signal is used at Xin, this pin remains unconnected.
6	<b>S1</b>		I	PD	Input for selecting CPU//PCI frequencies (see table 1,p.1).
18	<b>S0</b>		I	PU	Input for selecting CPU//PCI frequencies (see table 1,p.1).
8,9,11,12, 13,14,16	<b>PCI_F, PCI(0:5)</b>	VDD	O		PCI clock outputs, synchronous to the CPU clocks. If PCI_STP# is asserted low, PCI (0:5) stop in a low state, PCI_F does NOT.
19	<b>SDATA</b>	VDD	I/O	PU	Serial data input pin. Conforms to the SMBUS specification of a Slave Receiver device. This pin is an input when receiving data. It is an open drain output when acknowledging. See SMBUS function description, p.5.
20	<b>SCLK</b>	VDD	I	PU	Serial clock input pin. Conforms to the SMBUS 100KHz Specification.
22,23	<b>24/48M</b>	VDD	O		Programmable Peripheral clock outputs. Default to 48mhz for USB, but can be programmed to 24MHz through SMBUS bus.
26	<b>PCI_STP#</b>	VDD	I	PU	Input pin for stopping PCI (0:5) when active low. Default high. (see power management description p.3 )
27	<b>CPU_STP#</b>	VDD	I	PU	Input pin for stopping CPU (0:1) when active low. Default high. (see power management description p.3 ). If Byte1, Bit2 and SMBUS is low (0), then CPU0 DOES NOT STOP.
29,30,32, 33, 35, 36, 38	<b>SDRAM (FB,0:5)</b>	VDD	O		SDRAM clock outputs. They are buffered outputs of the signal applied at SDRAM_IN, pin39.
41,42	<b>CPU(0:1)</b>	VDD	O		Host (CPU) Clock outputs. See Table 1,p.1 for frequency selection.
44	<b>PWR_DWN#</b>	VDD	I	PU	Input pin for shutting down the device when asserted low. All outputs with the exception of SDRAM (FB,0:5), PLL's and crystal are stopped for minimum power consumption.
7,15,21,25 46, 48	<b>VDD</b>	-	P	-	3.3 Volt common power supply pins.
28,34	<b>VDD</b>	-	P	-	3.3 Volt power supply pins for SDRAM_IN, SDRAM (FB, 0:5) outputs.
40	<b>VDD</b>	-	P	-	3.3 or 2.5 Volt power supply pins for the CPU (0:1), outputs.
3,10,17, 24, 31, 37, 43	<b>VSS</b>	-	P	-	Common Ground pins.
39	<b>SDRAM_IN</b>	VDD	I	-	Input to SDRAM buffers.

Table 2

**A bypass capacitor (0.1 uF) should be placed as close as possible to each Vdd, Vddc, and Vdds pins. If these bypass capacitors are not close to the pins, their high frequency filtering characteristic will be canceled by the lead inductance of the traces.**

## Power Management Functions

All clocks can be individually enabled or stopped via the 2-wire control interface. All clocks are stopped in the low state. All clocks maintain a valid high period on transitions from running to stopped and on transitions from stopped to running when the chip was not powered down. On power up, the VCOs will stabilize to the correct pulse widths within about 0.5 mS. The CPU, SDRAM, and PCI clocks transition between running and stopped by waiting for one positive edge on PCICLK\_F followed by a negative edge on the clock of interest, after which high levels of the output are either enabled or disabled.

Pins 26 and 27 are inputs PCI\_STOP# and CPU\_STOP# respectively. A particular output is enabled only when both the serial interface and these pins indicate that it should be enabled. The device clocks may be disabled according to the following table in order to reduce power consumption. All clocks are stopped in the low state. All clocks maintain a valid high period on transitions from running to stopped. On low to high transitions of PWR\_DWN#, external circuitry should allow 0.5 mS for the VCOs to stabilize prior to assuming the clock periods are correct. The CPU and PCI clocks transition between running and stopped by waiting for one positive edge on PCICLK\_F followed by a negative edge on the clock of interest, after which high levels of the output are either enabled or disabled.

CPU_STOP#	PCI_STOP#	PWR_DWN#	CPU*	PCI	OTHER CLKs	XTAL & VCOs
X	X	0	LOW	LOW	LOW	OFF
0	0	1	LOW	LOW	RUNNING	RUNNING
0	1	1	LOW	Running	RUNNING	RUNNING
1	0	1	Running	LOW	RUNNING	RUNNING
1	1	1	Running	Running	RUNNING	RUNNING

Table 3

\*If Byte1, bit2 is programmed to a "0", then CPU0 is not affected by CPU\_STP#, and keeps running when CPU-STP# is asserted low.

## Power Management Timing

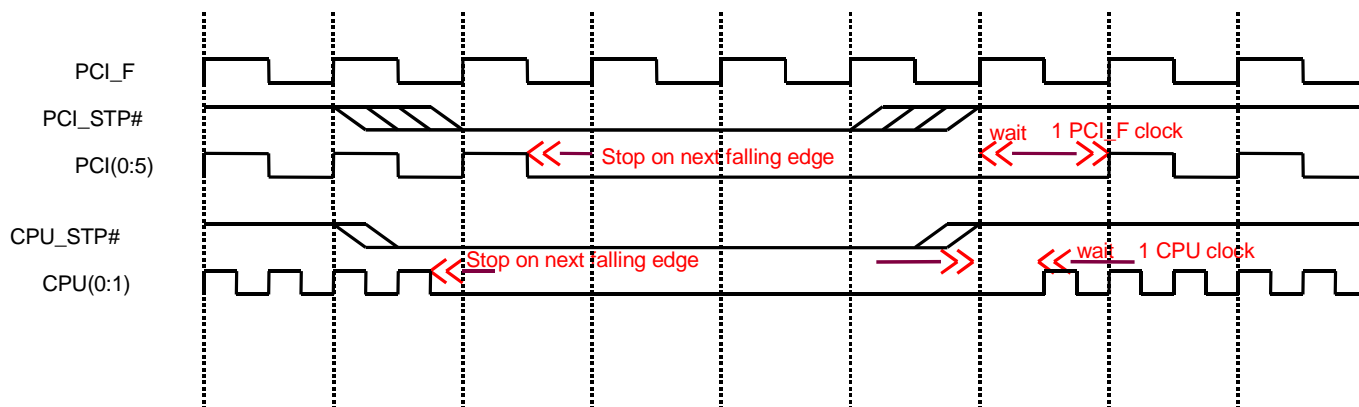

Fig.2

## 2-Wire SMBUS Control Interface

The 2-wire control interface implements a read/write slave only interface according to SMBUS specification. (See fig3). The device can be read back by using standard SMBUS command bytes. Sub addressing is not supported, thus all preceding bytes must be sent in order to change one of the control bytes. The 2-wire control interface allows each clock output to be individually enabled or disabled. 100 Kbits/second (standard mode) data transfer is supported. It also allows 24/48 MHz frequency selection and test mode enable as well as Spread Spectrum programmability.

During normal data transfer, the SDATA signal only changes when the SCLK signal is low, and is stable when SCLK is high. There are two exceptions to this. A high to low transition on SDATA while SCLK is high is used to indicate the start of a data transfer cycle. A low to high transition on SDATA while SCLK is high indicates the end of a data transfer cycle. Data is always sent as complete 8-bit bytes, after which an acknowledge is generated. The first byte of a transfer cycle is a 7-bit address with a Read/Write bit (R/W#) as the LSB. R/W# = 1 in read mode (see note1, below). R/W# = 0 in write mode.

The device will respond to writes to 10 bytes (max) of data to address **D2** by generating the acknowledge (low) signal on the SDATA wire following reception of each byte. If the device should be read then an address **D3** must be sent. Data is transferred MSB first at a max rate of 100kbits/S. The device will not respond to any other control interface conditions, and previously set control registers are retained.

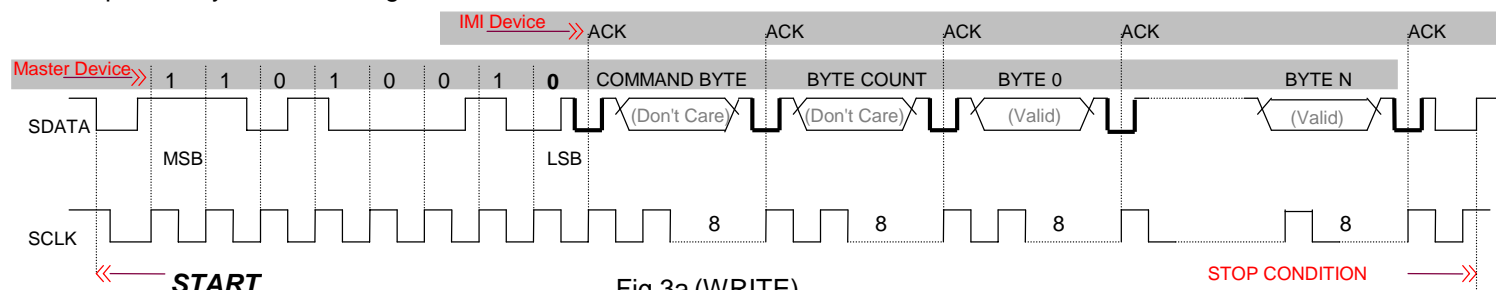

Fig.3a (WRITE)

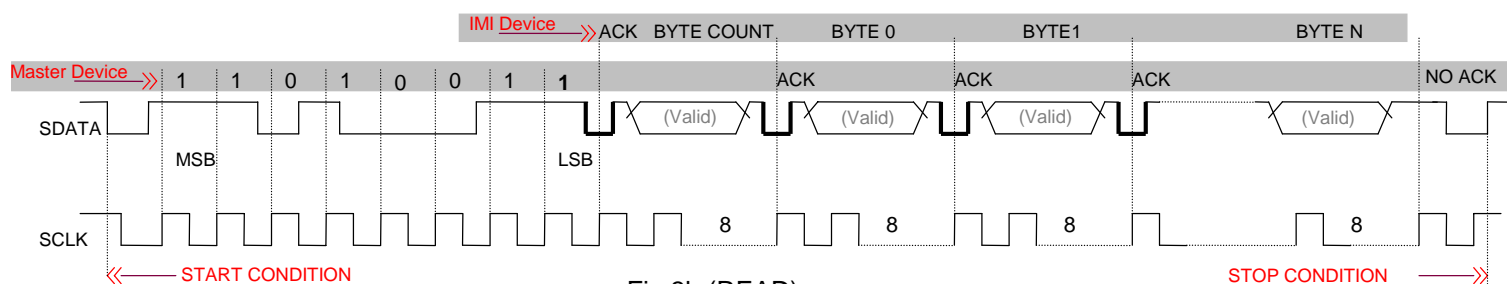

Fig.3b (READ)

Fig.3

**Note1:** Should the device be read, the address must be D3, therefore, the address' LSB is a 1 (for READ). After the device receives the address it will generate an acknowledge then immediately starts outputting data on the SDATA line. Data is transmitted following the SMBUS standard. After each full byte is transmitted the device will wait for an acknowledge from the receiver before transmitting the next byte. The transmission will end when the device detects a Stop condition generated by the receiver.

**SMBUS Frequency Clock Generator for Advanced Mobile Pentium® III Applications.****Serial Control Registers**

**NOTE:** The Pin# column lists the affected pin number where applicable. The @Pup column gives the state at true power up. Bytes are set to the values shown only on true power up, and not when the PWR\_DWN# pin is activated.

Following the acknowledge of the Address Byte (D2), two additional bytes must be sent:

- 1) "**Command Code**" byte, and
- 2) "**Byte Count**" byte.

Although the data (bits) in these two bytes are considered "don't care"; they must be sent and will be acknowledged.

**Byte 0: Function Select Register**

Bit	@Pup	Pin#	Description
7	0	*	Reserved
6	1	*	SST2
5	1	*	SST1
4	1	*	SST0
3	1	22	24/48M, 1 selects 48mhz, 0 selects 24MHz.
2	1	23	24/48M, 1 selects 48mhz, 0 selects 24MHz.
1	0		Bit1 Bit0
0	0		1 1 Tri-State (all outputs)
			1 0 <b>Spread Spectrum enabled</b>
			0 1 Test Mode
			0 0 NON spread spectrum operating mode

**Byte 1: CPU, AGP, 48/24 MHz Register (1 = Enable, 0 = Stopped)**

Bit	@Pup	Pin#	Description

6	x	-	Reserved
5	x	-	Reserved
4	x	-	Reserved
3	x	-	Reserved
2	x	-	Reserved
1	x	-	Reserved
0	x	-	Reserved

**Byte 5: Peripheral Control** (1 = Enable, 0 = Stopped)

Bit	@Pup	Pin#	Description
7	x	-	Reserved
6	x	-	Reserved
5	1	47	REF3 Enable/Stopped
4	1	45	REF2 Enable/Stopped
3	x	-	Reserved
2	x	-	Reserved
1	1	1	REF1 Enable/Stopped
0	1	2	REF0 Enable/Stopped

\* SST (0:2) are soft select pins used for setting the Spread Spectrum width options. See Spread Spectrum description next section.

**Byte 6: Dial-a-Frequency™ Register**

Bit	@Pup	Pin#	Description
7	0	-	N7, MSB
6	0	-	N6
5	0	-	N5
4	0	-	N4
3	0	-	N3
2	0	-	N2
1	0	-	N1
0	0	-	N0, LSB

**Byte 7: Dial-a-Frequency™ Register**

Bit	@Pup	Pin#	Description
7	0	-	Reserved
6	0	-	Reserved
5	0	-	R5
4	0	-	R4
3	0	-	R3
2	0	-	R2
1	0	-	R1
0	0	-	R0

**Byte 8: Dial-a-Frequency™ Register**

Bit	@Pup	Pin#	Description
7	0	-	Enable SMBUS N values
6	0	-	Enable SMBUS R values
5	0	-	Reserved
4	0	-	Reserved
3	0	-	Reserved
2	0	-	Reserved
1	0	-	Reserved
0	0	-	Reserved

**Dial-a-Frequency™ Feature**

SMBUS Dial-a-frequency feature is available in this device via bytes 6, 7 and 8.

These bytes allow the user to enter the N and R values that will enable them to program any CPU frequency desired following the formula:

$$F_{cpu} = \frac{P \times N}{R} \quad \text{Equ.(1)}$$

Where N and R values are programmed in binary into bytes 6 & 7 for N and byte 8 for R. See table below for min and max allowed values.

**Dial-a-Frequency™ Feature (Cont.)**

R	Min N	Max N
42	44	87
43	45	90
44	46	92
45	47	94
46	48	96
47	49	98
48	50	100
49	51	102
50	52	104
51	53	107

P is a large value PLL constant that depends on the last frequency selection achieved through the hardware selectors (S1, S0). P value may be determined from the following table:

S(1:0)	P
00,01	48008000
10,11	96016000

Therefore, if a 145MHz (use  $145 \times 10^6$ ) value is desired, then we should apply 145 into equation 1, and start by choosing R to be 47 (assume the last frequency selection has the value  $P = 96016000$ ):

$$145 \times 10^6 = \frac{96016000 \times N}{47} \Rightarrow N = 70.97775371$$

Since this N number must be entered in Binary, it can only be an integer, so it must be rounded up or down. Here we can rounded it up to 71, which will give us an exact CPU frequency of:

$$F_{cpu} = \frac{96016000 \times N}{47} = 145.045 \text{ MHz (accuracy + 310 ppm)}$$

If the above frequency is not accurate enough, then you must choose another R value and start from the beginning. For example choose  $R = 49$  and this will yield an  $N = 73.99808365$ , which is rounded to 74. If the 74 is applied in the formula 1, then  $F_{cpu} = 145.0038 \text{ MHz (accuracy + 26 ppm)}$ .

Other R values within the above limits may also be evaluated.

## Spread Spectrum Clock Generation (SSCG)

Spread Spectrum is a modulation technique applied here for maximum efficiency in minimizing Electro-Magnetic Interference radiation generated from repetitive digital signals mainly clocks. A clock accumulates EM energy at the center frequency it is generating. Spread Spectrum distributes this energy over a small frequency bandwidth therefore spreading the same amount of energy over a spectrum. This technique is achieved by modulating the clock down from or around the center of its resting frequency by a certain percentage (which also determines the energy distribution bandwidth). In this device, Spread Spectrum is enabled by setting SMBUS byte0, bit1 = 1, and bit0 = 0. The default of the device at power up keeps the Spread Spectrum disabled, it is therefore, important to have SMBUS accessibility to turn-on the Spread Spectrum function. Once the Spread Spectrum is enabled, the spread bandwidth option is selected by SST (0:2) in SMBUS byte 0, bits 4, 5 & 6 following table 4 below.

Down Spread

Center Spread

**Spread Spectrum Bandwidth Selection Table.**

SST2	SST1	SST0	Bandwidth	Direction
0	0	0	+/- 0.75%	Center
0	0	1	+/- 0.5%	Center
0	1	0	+/-0.35%	Center
0	1	1	+/-0.25%	Center
1	0	0	See Table 4B	Down
1	0	1		Down
1	1	0		Down
1	1	1		Down

**Table 4A**

**Note:** See Page 5 for Programming SST(0:2)

			CPU Frequency			
SST2	SST1	SST0	60MHz	66MHz	133MHz	100MHz
1	0	0	(-1.6%, -0.1%)	(-1.5%, 0%)	(-1.5%, 0%)	(-1.1%, +0.4%)
1	0	1	(-1.0%, 0%)	(-1.0%, 0%)	(-1.0%, 0%)	(-0.9%, +0.1%)
1	1	0	(-.8%, -.1%)	(-.7%, 0%)	(-.7%, 0%)	(-0.7%, 0%)
1	1	1	(-.65%, -.15%)	(-.5%, 0%)	(-.5%, 0%)	(-.5%, 0%)

**Table 4B**

## Maximum Ratings

Maximum Input Voltage Relative to VSS: VSS - 0.3V

Maximum Input Voltage Relative to VDD: VDD + 0.3V

Storage Temperature: -65°C to + 150°C

Operating Temperature: 0°C to +85°C

Maximum ESD protection 2000V

Maximum Power Supply: 5.5V

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, Vin and Vout should be constrained to the range:

$$VSS < (V_{in} \text{ or } V_{out}) < VDD$$

Unused inputs must always be tied to an appropriate logic voltage level (either VSS or VDD).

## DC Parameters

Characteristic	Symbol	Min	Typ	Max	Units	Conditions
Input Low Voltage	VIL	-	-	0.8	Vdc	S(0:1), PCI_STP#,

Note 1: All outputs are loaded as per Table 6. CPU(0:1) outputs are measure at 1.25V. SDRAM (FB, 0:5), PCI(F,0:5), REF (0:2), 24/48M outputs are measured at 1.5V.

### Crystal and Reference Oscillator Parameters

Characteristic	Symbol	Min	Typ	Max	Units	Conditions
Frequency	F <sub>o</sub>	12.00	14.31818	16.00	MHz	
Tolerance	TC	-	-	+/-100	PPM	Calibration note 1
	TS	-	-	+/- 100	PPM	Stability (Ta -10 to +60C) Note 1
	TA	-	-	5	PPM	Aging (first year @ 25C) Note 1
Mode	OM	-	-	-		Parallel Resonant
Pin Capacitance	CP		36		pF	Capacitance of XIN and Xout pins to ground (each)
DC Bias Voltage	V <sub>BIAS</sub>	0.3V <sub>dd</sub>	V <sub>dd</sub> /2	0.7V <sub>dd</sub>	V	
Startup time	T <sub>s</sub>	-	-	30	μS	
Load Capacitance	CL	-	20	-	pF	The crystal's rated load. Note 1
Effective Series resistance (ESR)	R1	-	-	40	Ohms	
Power Dissipation	DL	-	-	0.10	mW	Note 1
Shunt Capacitance	CO	-	--	8	pF	Crystal's internal package capacitance (total)

For maximum accuracy, the total circuit loading capacitance should be equal to CL. This loading capacitance is the effective capacitance across the crystal pins and includes the device pin capacitance (CP) in parallel with any circuit traces, the clock generator and any onboard discrete load capacitors.

#### Budgeting Calculations

Typical trace capacitance, (< half inch) is 4 pF, Load to the crystal is therefore = 2.0 pF  
 Clock generator internal pin capacitance of 36 pF, Load to the crystal is therefore = 18.0 pF  
 The total parasitic capacitance would therefore be = 20.0 pF.

Note 1: It is recommended but not mandatory that a crystal meets these specifications.

## PCB Layout Suggestion

- Via to VDD Island
- Via to GND Plane

This is only a layout recommendation for best performance and lower EMI. The designer may choose a different approach but C4, C5, C6, C7, C8, C9, C10; C11 and C12 (all are 0.1μf) should always be used and placed close to their VDD pins.

APPROVED PRODUCT

**C9806J**

**SMBUS Frequency Clock Generator for Advanced Mobile Pentium® III Applications.**

## Ordering Information

Part Number	Package Type	Production Flow
C9806JBY	48 PIN SSOP	Commercial, 0°C to +70°C
C9806JBT	48 PIN TSSOP	Commercial, 0°C to +70°C

Document # : 38-07051

**Note:** The ordering part number is formed by a combination of device number, device revision, package style, and screening as shown below.

**Marking:** Example: Cypress  
C9806JBY  
Date Code, Lot #

C9806JBY

Package
Y = SSOP
T = TSSOP
Revision
Device Number

## Notice

Cypress Semiconductor Corporation reserves the right to change or modify the information contained in this data sheet, without notice Cypress Semiconductor Corporation does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress Semiconductor Corporation does not convey any license under its patent rights nor the rights of others Cypress Semiconductor Corporation does not authorize its products for use as critical components in life-support systems or critical medical instruments, where a malfunction or failure may reasonably be expected to result in significant injury to the user.

APPROVED PRODUCT

**C9806J**

**SMBUS Frequency Clock Generator for Advanced Mobile Pentium® III Applications.**

**Document Title:** C9806J SMBus Frequency Clock Generator for Advanced Pentium® III Applications

**Document Number:** 38-07051
