

APPROVED PRODUCT

C9811x2

Low EMI Clock Generator for Intel® 810 Chipset Systems

Product Features

- Intel's 810 clock solution
- 3 copies of CPU Clock (CPU[0:1] and CPU_ITP)
- 9 copies of SDRAM Clock (SDRAM[0:7] and DCLK)
- 8 copies of PCI clock
- 2 copies of 3V66 Clock
- 2 copies of APIC Clock, synchronous to PCI Clock
- 1 REF Clock
- 2 USB Clocks (Non SSC)
- Power Down Feature
- Spread Spectrum Support
- SMBUS Support for turning off unused clocks
- 56 Pin SSOP Package

Frequency Table (MHz)

SEL1	SEL0	CPU	SDRAM	PCI
0	0	Tri-state	Tri-state	Tri-state
0	1	Test mode (see table2)		
1	0	66.6	100	33.3
1	1	100	100	33.3

Table 1

Note: The following clocks remain fixed frequencies except in Test Mode.

3V66=66.6MHz, USB/DOT=48MHz, REF=14.318MHz and IOAPIC=16.6 or 33.3MHz depending on power up selection.

Low EMI Clock Generator for Intel® 810 Chipset Systems

Pin Description

PIN No.	Pin Name	PWR	I/O	TYPE	Description
1	ASEL/REF	VDD	I/O		3.3V 14.318 MHz clock output. This pin also serves as the select strap for IOAPIC clock frequency. If strapped low during power up, IOAPIC clocks run at PCI/2 (16.6 MHz). If not strapped, it runs at 33 MHz. This pin has a 50K internal pull-up (+/- 20K).
3	XIN	VDD	I	OSC1	14.318MHz Crystal input
4	XOUT	VDD	O		14.318MHz Crystal output
11, 12, 13, 15, 16, 18, 19, 20	PCI0/ICH PCI(1..7)	VDD	O		3.3V PCI clock outputs
7, 8	3V66(0,1)	VDD	O		3.3V Fixed 66.6 MHz clock outputs
25, 26	USB (0:1)	VDD	O		3.3V Fixed 48 MHz clock outputs
28, 29	SEL(0,1)	VDD	I		3.3V LVTTL compatible inputs for logic selection. Has an internal pull-up (Typ. 250K Ω)
30	SDATA	VDD	I		I ² C compatible SDATA input. Has an internal pull-up (>100K Ω)
31	SCLK	VDD	I		I ² C compatible SCLK input. Has an internal pull-up (>100K Ω)
32	PD#	VDD	I		3.3V LVTTL compatible input. Device enters powerdown mode When held LOW. Has an internal pull-up (>100K Ω)
34	DCLK	VDD	O		3.3V output running 100MHz
36, 37, 39, 40, 42, 43, 45, 46	SDRAM(7..0)	VDDS	O		3.3V output running 100MHz. All SDRAM outputs can be turned off through SMBUS.
49, 50, 52	CPU(2)_ITP, CPU(1,0)	VDDC	O		2.5V Host bus clock outputs. 66 or 100MHz depending on state of SEL0 and SEL1 pins.
54, 55	IOAPIC(1,0)	VDDI	O		2.5V clock outputs running rising edge synchronous with the PCI clock frequency. 16.67 MHz or 33.3 MHz dependent on power up strapping of REF (Pin 1).
2, 9, 10, 21, 27	VDD	-			3.3V Power Supply
22	VDDA	-	P		Analog circuitry 3.3V Power Supply
23	VSSA	-	P		Analog circuitry power supply Ground pins.
51, 53	VDDC, VDDI	-	P		2.5V Power Supply's
5, 6, 14, 17, 24, 35, 41, 47, 48, 56	VSS	-	P	-	Common Ground pins.
33, 38, 44	VDDS	-	P	-	3.3V power support for SDRAM clock output drivers.

A bypass capacitor (0.1 μ F) should be placed as close as possible to each positive power pin. If these bypass capacitors are not close to the pins their high frequency filtering characteristic will be cancelled by the lead inductance of the traces.

Low EMI Clock Generator for Intel® 810 Chipset Systems

Test Mode Function

Test Mode Functionality

SEL1	SEL0	CPU	SDRAM	3V66	PCI	48 MHz	REF	IOAPIC
0	1	TCLK÷2	TCLK÷2	TCLK÷3	TCLK÷6	TCLK÷2	TCLK	TCLK÷6

Table 2

Note: TCLK is a test clock over driven on the XIN input during test mode.

Power Management Functions

Power Management on this device is controlled by a single pin, PD# (pin32). When PD# is high (default) the device is in running and all signals are active.

When PD# is asserted (forced) low, the device is in shutdown (or in power down) mode and all power supplies (3.3V and 2.5V except for VDDA/pin 22) may be removed. When in power down, all outputs are synchronously stopped in a low state (see Fig.2 below), all PLL's are shut off, and the crystal oscillator is disabled. When the device is shutdown the I²C function is also disabled.

Power Management Timing

Fig.2

Power Management Current

PD#, SEL[1..0] (CPU Clock)	Maximum 2.5 Volt Current Consumption (VDD2.5 = 2.625)	Maximum 3.3 Volt Current Consumption (VDD3.3 = 3.465 V)
0XX (Power down)	100 μ A	200 μ A
110 (66MHz)	70 mA	280 mA
111 (100MHz)	100 mA	280 mA

Table 3

When exiting the power down mode, the designer must supply power to the VDD pins first, a minimum of 200mS before releasing the PD# pin high.

**Low EMI Clock Generator for Intel® 810 Chipset Systems****Clock Synchronization and Phase Alignment**

This device incorporates IOAPIC clock synchronization. With this feature, the IOAPIC clocks are derived from the CPU clock. The IOAPIC clock lags the CPU clock by the specified 1.5 to 3.5 nSec. Figure 3 shows the relationship between the CPU and IOAPIC clocks.

Device Clock Phase Relationships

Fig.3

Low EMI Clock Generator for Intel® 810 Chipset Systems

Power on Bi-Directional Pins

Power Up Condition:

Pin1 is a Power up bi-directional pin and is used for selecting the IOAPIC frequency in page 1, table 1. During power-up of the device, this pin is in input mode (see Fig 4, below), therefore; it is considered input select pins internal to the IC. After a settling time, the selection data is latch into the internal control register and this pin becomes a clock output. If strapped low the IOAPIC clock is set to $\frac{1}{2}$ of the PCI frequency (16.6 MHz). If strapped high IOAPIC is 33.3 MHz.

Fig.4

Strapping Resistor Options:

The power up bi-directional pins have a large value pull-up each (250K Ω), therefore, a selection "1" is the default. If the system uses a slow power supply (over 5mS settling time), then **it is recommended** to use an external Pull-up (R_{up}) in order to insure a high selection. In this case, the designer may choose one of two configurations, see Fig.5A and B.

Fig. 5A represents an additional pull up resistor 50K Ω connected from the pin to the power line, which allows a faster pull to a high level.

If a selection "0" is desired, then a jumper is placed on JP1 to a 5K Ω resistor as implemented as shown in Fig.5A. Please note the selection resistors (R_{up} and R_{dn}) are placed before the Damping resistor (R_d) close to the pin.

Fig. 5B represent a single resistor 10K Ω connected to a 3-way jumper, JP2. When a "1" selection is desired, a jumper is placed between leads 1 and 3. When a "0" selection is desired, a jumper is placed between leads 1 and 2.

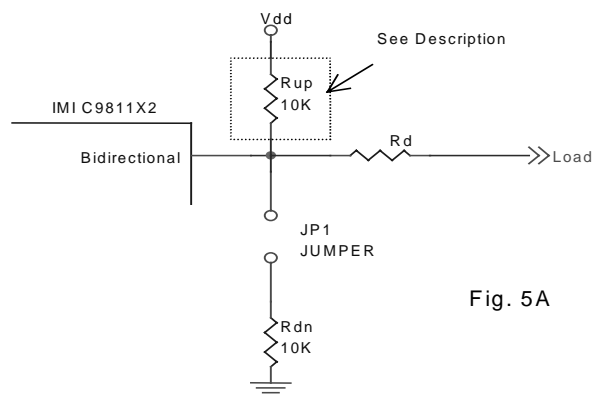

Fig. 5A

Fig. 5B

Low EMI Clock Generator for Intel® 810 Chipset Systems

2-Wire SMBUS Control Interface

The 2-wire control interface implements a write slave only interface according to SMBus specification. (See Fig. 7 / P. 8). Sub addressing is not supported, thus all preceding bytes must be sent in order to change one of the control bytes. The 2-wire control interface allows each clock output to be individually enabled or disabled. 100 Kbits/second (standard mode) data transfer is supported.

During normal data transfer, the SDATA signal only changes when the SDCLK signal is low, and is stable when SDCLK is high. There are two exceptions to this. A high to low transition on SDATA while SDCLK is high is used to indicate the start of a data transfer cycle. A low to high transition on SDATA while SDCLK is high indicates the end of a data transfer cycle. Data is always sent as complete 8-bit bytes, after which an acknowledge is generated. The first byte of a transfer cycle is an 8-bit address. W# = 0 in write mode.

The device will respond to writes to 10 bytes (max) of data to address **D2** by generating the acknowledge (low) signal on the SDATA wire following reception of each byte. Data is transferred MSB first at a max rate of 100kbts/S. The device will not respond to any other control interface conditions, and previously set control registers are retained.

SMBUS Test Circuitry

Fig.6

Note: Buffer is 7407 with VCC @ 5.0 V

**Low EMI Clock Generator for Intel® 810 Chipset Systems****Serial Control Registers**

NOTE: The Pin# column lists the affected pin number where applicable. The @Pup column gives the state at true power up. Bytes are set to the values shown only on true power up.

Following the acknowledge of the Address Byte, two additional bytes must be sent:

- 1) "**Command Code**" byte, and
- 2) "**Byte Count**" byte.

Although the data (bits) in these two bytes are considered "don't care"; they must be sent and will be acknowledged.

After the Command Code and the Count bytes have been acknowledged, the sequence described below (Byte 0, Byte 1, and Byte2) will be valid and acknowledged.

Byte 0: CPU Clock Register (1=Enable, 0=Disable, Default=07)

Test and Measurement Condition

Fig.8

Low EMI Clock Generator for Intel® 810 Chipset Systems

Spread Spectrum Clock Generation (SSCG)

Spread Spectrum is a modulation technique applied here for maximum efficiency in minimizing Electro-Magnetic Interference radiation generated from repetitive digital signals mainly clocks. A clock accumulates EM energy at the center frequency it is generating. Spread Spectrum distributes this energy over a small frequency bandwidth therefore spreading the same amount of energy over a spectrum. This technique is achieved by modulating the clock down from (Fig.9A) or around the center (Fig.9B) of its resting frequency by a certain percentage (which also determines the energy distribution bandwidth). In this device, Spread Spectrum is enabled by setting SMBUS byte0, bit3 = 1. The default of the device at power up keeps the Spread Spectrum disabled, it is therefore, important to have SMBUS accessibility to turn-on the Spread Spectrum function. Once the Spread Spectrum is enabled, the spread bandwidth option is selected by SST(0:2) in SMBUS byte 5, bits 5, 6 & 7 following tables 4A, and 4B below.

In Down Spread mode the center frequency is shifted down from its rested (non-spread) value by $\frac{1}{2}$ of the total spread %. (ex.: assuming the center frequency is 100MHz in non-spread mode; when down spread of -0.5% is enabled, the center frequency shifts to 99.75MHz.).

In Center Spread mode, the Center frequency remains the same as in the non-spread mode.

Down Spread

Fig.9A

Center Spread

Fig.9B

Spread Spectrum Selection Tables

I ² C BYTE5 Bit[7:5]	Center Frequency (MHz)	Spread %
100	66/100	± 0.25
101	66/100	± 0.35
110	66/100	± 0.5
111	66/100	± 0.7

Table 4A

I ² C BYTE5 Bit[7:5]	Center Frequency (MHz)	Spread %
000	66/100	- 0.5
001	66/100	- 0.7
010	66/100	- 1.0
011	66/100	- 1.5

Table 4B

**Low EMI Clock Generator for Intel® 810 Chipset Systems****Maximum Ratings**

Maximum Input Voltage Relative to VSS:	VSS - 0.3V
Maximum Input Voltage Relative to VDD:	VDD + 0.3V
Storage Temperature:	-65°C to + 150°C
Operating Temperature:	0°C to +85°C
Maximum ESD protection	2KV
Maximum Power Supply:	5.5V

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, Vin and Vout should be constrained to the range:

$$VSS < (V_{in} \text{ or } V_{out}) < VDD$$

Unused inputs must always be tied to an appropriate logic voltage level (either VSS or VDD).

DC Parameters

Characteristic	Symbol	Min	Typ	Max	Units	Conditions
Input Low Voltage	VIL1	-	-	1.0	Vdc	note 1
Input High Voltage	VIH1	2.0	-	-	Vdc	
Input Low Voltage	VIL2	-	-	1.0	Vdc	note 2
Input High Voltage	VIH2	2.2	-	-	Vdc	
Input Low Current (@VIL = VSS)	IIL	-66		-5	μA	For internal Pull up resistors, note 1 and note 3
Input High Current (@VIL = VDD)	IIH			5	μA	
Tri-State leakage Current	Ioz	-	-	10	μA	
Dynamic Supply Current	Idd3.3V	-	-	280	mA	Sel1 = Sel0 = 1, note 4
Dynamic Supply Current	Idd2.5V	-	-	100	mA	Sel1 = Sel0 = 1, note 4
Static Supply Current	Isdd	-	-	3.2	mA	PD# = 0, Sel1 = Sel0 = x, note 4
Input pin capacitance	Cin	-	-	5	pF	
Output pin capacitance	Cout	-	-	6	pF	
Pin capacitance	Lpin	-	-	7	nH	
Crystal pin capacitance	Cxtal	32	34	38	pF	Measured from Pin to Ground. note 5
Crystal DC Bias Voltage	VBIAS	0.3Vdd	Vdd/2	0.7Vdd	V	
Crystal Startup time	Txs	-	-	40	μS	From Stable 3.3V power supply.
VDD=VDDS = 3.3V ±5%, VDDC = VDDI = 2.5 ± 5%, TA = 0° to +70°C						

Note1: Applicable to input signals: Sel(0:1), PD#

Note2: Applicable to Sdata, and Sclk.

Note3: Although internal pull-up resistors have a typical value of 250K, this value may vary between 200K and 500K.

Note4: All outputs loaded as per table 3.

Note5: Although the device will reliably interface with crystals of a 17pF – 20pF CL range, it is optimized to interface with a typical CL = 18pF crystal specifications.

Clock name	Max Load (in pF)
CPU, IOAPIC, REF, USB (0:1)	20
PCI, SDRAM, 3V66(0,1)	30

T Fall	SDRAM CLK fall time	0.4	1.6	0.4	1.6	nS	1
Tjc-c	48 MHz Clock Cycle to Cycle Jitter	-	500	-	500	pS	2
tpZL,tpZH	Output enable delay (all outputs)	1.0	10.0	1.0	10.0	nS	
tpLZ,tpZH	Output disable delay (all outputs)	1.0	10.0	1.0	10.00	nS	
tstable	All clock Stabilization from power-up		3		3	mS	5

Notes:

1. Output drivers must have monotonic rise/fall times through the specified VOL/VOH levels.
2. Period, jitter, offset and skew measured on rising edge @ 1.25V for 2.5V clocks and @ 1.5V for 3.3V clocks.
3. THigh is measured at 2.0V for 2.5V outputs, 2.4V for 3.3V outputs.
4. TLow is measured at 0.4V for all outputs.
5. The time specified is measured from when Vddq achieves its nominal operating level (typical condition Vddq = 3.3V) the frequency output is stable and operating within specification.
6. Trise and Tfall are measured as a transition through the threshold region Vol = 0.4V and Voh = 2.0V
7. The average period over any 1 μ S period of time must be greater than the minimum specified period.

Characteristic	Symbol	Min	Typ	Max	Units	Conditions
Pull-Up Current	IOH ₁	19	-	-	mA	Vout = VDD - 1.0 V
Pull-Up Current	IOH ₂	62	-	-	mA	Vout = 1.4 V
Pull-Down Current	IOL ₁	18	-	-	mA	Vout = 0.4 V
Pull-Down Current	IOL ₁	59	-	-	mA	Vout = 1.5 V
Dynamic Output Impedance	Z ₀	10		24	Ω	
Rise Time Min Between 0.4 and 2.4 V	Tr	0.4	-	-	nS	30pF Load
Fall Time Max Between 0.4 and 2.4 V	Tf	-	-	1.33	nS	30pF Load
VDD=VDDS=3.3V ±5%, VDDC=VDDI=2.5±5%, TA=0 to 70°C						

Low EMI Clock Generator for Intel® 810 Chipset Systems

Suggested Crystal Oscillator Parameters

Characteristic	Symbol	Min	Typ	Max	Units	Conditions
Frequency	F _o	12.00	14.31818	16.00	MHz	
Tolerance	TC	-	-	+/-100	PPM	Note 1
	TS	-	-	+/- 100	PPM	Stability (Ta -10 to +60C) Note 1
	TA	-	-	5	PPM	Aging (first year @ 25C) Note 1
Mode	OM	-	-	-		Parallel Resonant, Note 1
Load Capacitance	CL	-	18	-	pF	The crystal's rated load. Note 1
Effective Series resistance (ESR)	R1	-	40	-	Ohms	Note 1
Power Dissipation	DL	-	-	0.10	mW	Note 1
Shunt Capacitance	CO	-	--	8	pF	Crystal's internal package capacitance (total)

Note1: For best performance and accurate Center frequencies of this device, It is recommended but not mandatory that the chosen crystal meets these specifications

For maximum accuracy, the total circuit loading capacitance should be equal to CL. This loading capacitance is the effective capacitance across the crystal pins and includes the device pin capacitance (CP) in parallel with any circuit traces, the clock generator and any onboard discrete load capacitors.

Budgeting Calculations

Device pin capacitance: C_xtal = 36pF

In order to meet the specification for CL = 18pF following the formula:

$$C_L = \frac{C_{XIN} \times C_{XOUT}}{C_{XIN} + C_{XOUT}}$$

Then the board trace capacitance between Xin and the crystal should be no more than 2pF. (same is applicable to the trace between Xout and the crystal)

In this case the total capacitance from the crystal to Xin will be 36pF. Similarly the total capacitance between the crystal and Xout will be 36pF. Hence using the above formula:

$$C_L = \frac{36pF \times 36pF}{36pF + 36pF} = 18pF$$
