

Attention: 401GF System Designers

This 401GF Evaluation Kit contains the original version of the PowerPC 401GF embedded controller, part number PPC401GF-MA50C2. In subsequent versions of the 401GF embedded controller, the Address Latch Enable signal (/ALE) will change polarity from active low to active high. This change has been implemented to ease system design and improve system performance when using industry-standard peripherals.

System designers should contact IBM for information regarding availability of subsequent versions to insure design compatibility. As always, designers should consult the latest copy of the technical data sheet along with the current version of the chip errata before starting any system level design.

Please contact IBM support at (919) 254-1810 with questions or concerns regarding this issue.
